

ISO 16703:2004, Soil quality - Determination of content of hydrocarbon in the range C10 to C40 by gas chromatography

ISO 16703:2004 specifies a method for the quantitative determination of the mineral oil (hydrocarbon) content in field-moist soil samples by gas chromatography. The method is applicable to mineral oil contents (mass fraction) between 100 mg/kg and 10 000 mg/kg soil, expressed as dry matter, and can be adapted to lower detection limits. ISO 16703:2004 is applicable to the determination of all hydrocarbons with a boiling range of 175 °C to 525 °C, n-alkanes from C₁₀H₂₂ to C₄₀H₈₂, isoalkanes, cycloalkanes, alkylbenzenes, alkyl-naphthalenes and polycyclic aromatic compounds, provided that they are not absorbed on the specified column during the clean-up procedure. ISO 16703:2004 is not applicable to the quantitative determination of hydrocarbons < C₁₀ originating from gasolines. On the basis of the peak pattern of the gas chromatogram obtained, and of the boiling points of the individual n-alkanes listed in Annex B, the approximate boiling range of the mineral oil and some qualitative information on the composition of the contamination can be achieved.

31. aug 2011 Soil quality - Determination of content of hydrocarbon in the range range C10 to C40 by gas chromatography (ISO 16703:2004). Qualite du called TPH, or total petroleum hydrocarbon determination. For TPH analysis, The Agilent Intuvo 9000 GC is designed to enable Ultra-Fast GC separations with a high Soil Quality-Determination of content of hydrocarbon in the range C10 to C40 by gas chromatography.
